TITLE

METHOD FOR DEVELOPING MULTILAYER IMAGEABLE ELEMENTS

ABSTRACT

A method for forming an image by imaging and developing a multi-layer

5   imageable element, in which the developer is fresh developer and the developer is

not reused, is disclosed. Much smaller variation in dot percentage is obtained

when each imaged imageable element is developed in fresh developer than when

the developer is reused to develop additional imaged imageable elements. The

method is especially suited to the formation of images using stochastic screening.

10   Either a solvent based developer or a high pH developer may be used.
